Online Security and Privacy

Investing in ourselves, our colleagues and team members is also an investment in our organisation. Online internet use is a certainty in this day and age as it has become a virtual life, from internet banking to internet information searching, social media activity, cell phone and email communications amongst others. This electronic exposure comes with considerable risk to security and privacy.

Our information packed 1-day Applied Security and Privacy Course, is a rich extract of our Advanced Security and Privacy Course, which is not an IT intensive course, but rather a practical experience for the individual who is empowered with knowledge and a set of useful tools to neutralise these very real risks.

Who is this course for:

- The careful internet user to the privacy connoisseur, even if you are a casual user of the internet or surrounded by family and friends who are active social media users, the course will provide further understanding of the risk to reputations, safety of family and personal finances, and to take steps to secure them
- The corporate employee, from the marketing department or the human resources executive who make use of the internet and other online sources as part of their work
- Government officials and law enforcement personnel, who could be targeted by ill intended persons, criminals or crime groups
- Lawyers, prosecutors and members of the judiciary, not only could their reputations be targeted and harmed, but also face physical risks
- Investigative journalists, online investigators who not only have to protect themselves but also keep their online activity secure and private
- Victims of domestic violence and stalking, it is well proven that victims of domestic violence are either brutally assaulted or murdered by their abusive partners, this course will provide active measures to protect yourself and family to hide from these monsters
- Identity theft or 419 scam victims, not only is this an increasing crime, it is highly intrusive and completely compromises the victim's security and privacy
- High profile and wealth individuals, and public figures, not only face the risk of harassment, stalking, reputational damage and scams but also physical violence, and kidnapping, this course will provide the chance to take control of private information

"*I have nothing to hide*" they say! Think again, and if you still feel the same way about your security and privacy, send us your email login credentials; username and password, to securitypriv@protonmail.com that we can read and analyse all your email messages.

We don't really want to read your emails and predict that no one will take up our offer, but it speaks for itself.

Topics covered will include:

- An overview of online information risks
- Security and privacy preparation
- Basic computer security

- Internet browser security
- Personal data assessment
- Social Networks
- Online Accounts
- Credit companies
- Permanently erasing data
- Anonymous communications
- Cell phone security
- Data, static and in motion
- Life changes
- Dealing with leaked data and response plan
